April 1962

- FOREWORD -

A large share of the Nation's vegetables are grown on Florida farms. Florida ranks second in the Nation in the production of vegetables for fresh market. The purpose of this publication is to assemble into one report the basic vegetable statistics and to make it available to Florida's vegetable growers, shippers, agricultural leaders, research workers and others.

This publication contains the official estimates of acreage, yields, production, price, and value for 18 vegetable and melon crops. Estimates are included for counties and areas as well as the State. The estimates are further broken down into seasonal groups of fall, winter, and spring. Also included in this publication are rail and truck shipments by months. Production and marketing costs and returns on selected vegetable crops are shown.

ACKNOWLEDGMENTS

The cooperation of the vegetable growers, packers, shippers, marketing organizations, seedsmen, processors, railroad representatives and others, who contributed the basic information for this publication, is appreciated. Only through the cooperation of these individuals is this publication possible.

Shipments were provided by the Florida State Marketing Bureau. Cost and return data were contributed by Dr. D. L. Brooke, Associate Agricultural Economist of the University of Florida. The assistance of the Agricultural Extension Service through its County Agricultural Agents, Federal-State Inspection Service, State Plant Board, State Farm Market Managers, Federal-State Frost Warning Service, and the Weather Bureau is gratefully acknowledged.

Much credit is due Mrs. Doris Schankweiler and Miss Arlene Kruse for their painstaking work in checking for accuracy and typing this publication.

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPS - In order to show supplies for a shorter period of time than the entire marketing season, seasonal estimates are made for most vegetable crops. In Florida, the marketing season is generally broken into three groups, depending on the time of harvest.

FALL - October, November, December

WINTER - January, February, March

SPRING - April, May, June

This arrangement is not as precise as indicated as there is considerable overlapping in the marketing seasons for individual crops. Also it has been considered practical to carry cabbage, cauliflower, escarole, lettuce and strawberries as winter crops since the heaviest volume is generally harvested during this period.

PLANTED ACREAGE is the total acreage which has been planted for harvest during one designated season. To avoid duplication, acreage lost and replanted to the same crop in time for harvest in the same season is counted only once.

ACRES FOR HARVEST is the acreage harvested or partially harvested plus any additional acreage which reached maturity, but was not harvested due to low prices or other economic conditions. Acreage lost before or at maturity through natural causes is not included in the acreage for harvest.

YIELD is the total production of merchantable quality produced on an acre basis and includes any unharvested production left in fields for economic reasons.

PRODUCTION includes the quantity actually harvested plus any quantity that was left due to economic abandonment where losses of this type occur.

ECONOMIC ABANDONMENT is that portion of the crop that reaches maturity and is of merchantable quality but is not harvested because of low prices or other economic factors.

PRODUCTION OF VALUE is the total production less the quantity abandoned due to economic reasons.

AVERAGE PRICES represent the F.O.B. price received or its equivalent for all grades and quality of the commodity less selling charges and are on a hundredweight basis.

TOTAL VALUE is the average price received times the production of value.

PROCESSED VEGETABLES is the acreage of vegetables in Florida planted solely for canning and other processing purposes during the period covered by this publication and has been confined principally to cucumbers for pickles, spinach, and a relatively small percent of the bean crop. The greater part of the bean acreage and all the tomato acreage is planted primarily for fresh market, but each year, substantial quantities of each commodity are canned or frozen.

In order to show the utilization of the production from the acreage of beans and tomatoes brought to harvest, three columns on production are used in the State Summaries. The first shows the total production, the second shows the production sold for fresh market consumption, and the third shows the production sold for processing (either canned or frozen).

MIXED RAIL CARS - Mixed rail car waybills are tabulated for the contents in each mixed car of vegetables shipped. The total quantity of each commodity is then converted into the equivalent of a straight rail car.

*VEGETABLES
ANNUAL SUMMARY
1960-61*

Important Crops

Florida vegetable production during the 1960-61 season was 11 percent more than the 1959-60 season and 13 percent above the 10-year average. The 1960-61 production of 38,903,000 hundredweight compares with 34,936,000 hundredweight the previous year and the average production of 34,316,000 hundredweight. The increased production was the result of unusually good yields on practically all vegetable crops. Harvested acreage of the 18 vegetable and melon crops on which estimates are made, totaled 316,400 acres, 6 percent less than 1959-60 and 13 percent below average.

Value of production during 1960-61 season was \$159,598,000, up slightly from the preceding season and 7 percent above average. Based on value of production, the five leading vegetable crops in Florida during 1960-61 season were: (1) tomatoes; (2) snap beans; (3) sweet corn; (4) potatoes; and (5) green peppers.

Growing conditions during the year varied from poor to excellent, depending on the area and the season of the year. Plantings of vegetable crops for fall production were delayed by excessively heavy rains and wet soil. Winds and rains from Hurricane Donna caused some temporary delays and loss of acreage. Again in the latter part of October and November, rains delayed plantings in Dade County and the Fort Myers-Immokalee areas. December weather was mostly favorable for vegetable production. During January, several cold air masses covered the State. Frost and freeze damage to vegetables was light, mostly retarding growth, with some leaf burn on tender crops. Heavy rains in mid-January in Dade County sharply reduced winter potato production. Favorable conditions during February were followed by severe frost and freeze damage on March 10-11. The Everglades area suffered a heavy loss of sweet corn and snap bean acreage. April and May conditions tended to promote good growth for most vegetable crops although many areas were becoming dry. Yields were excellent on several spring crops, especially potatoes in the Hastings area and sweet corn at Zellwood.

The five leading vegetable counties, based on harvested acreage, accounted for 68 percent of the total vegetable acreage harvested last year. The five leading melon counties, based on harvested acreage, accounted for only 42 percent of the melon acreage harvested last year.

Florida
Leading Vegetable and Melon Counties 1960-61
Based on Harvested Acreage

Rank	Vegetables, Excluding Melons			Melons		
	County	Percent of		County	Percent of

LIMA BEANS

Reduced possible three lines 1960-61

Florida lima bean production during the 1960-61 crop year was 178,000 bushels, 19 percent more than the 150,000 bushels produced in 1959-60 but 19 percent below average. Value of production in 1960-61 at \$562,000 was 12 percent more than the previous year but 19 percent less than average. The acreage harvested in 1960-61 was estimated at 1,650 acres, the same as the previous year, but 39 percent below the 10-year average. The average yield for the entire crop year was 108 bushels per acre.

Early fall harvest began in North Florida counties in October followed by a continued, but light supply from the Plant City area. Most winter and early spring lima bean shipments originated in the Pompano area and moved heavily to intrastate points. Spring crop supplies were again available in an increased amount from Plant City and later from North Florida. Warm February weather hastened maturity of late winter and early spring limas in the Pompano area. Leaf miners were a problem in most fields. Cool nights and cold winds the first three weeks of April retarded the growth of North Florida plantings. Generally favorable weather for growing and harvesting prevailed during the remainder of the season with a good spring yield being obtained.

Some

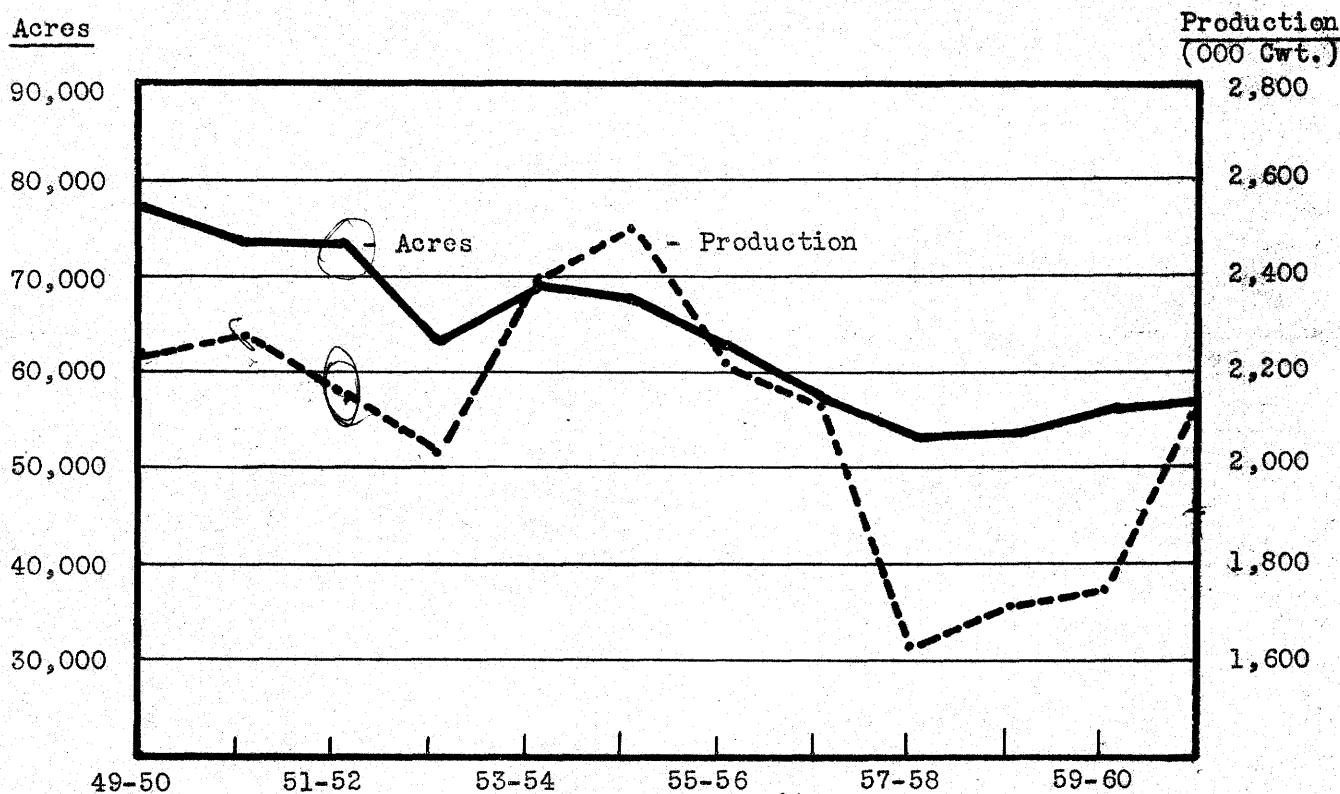

SNAP BEANS

1960-61

Florida snap bean production during the 1960-61 crop year was 6,977,000 bushels, 18 percent more than the 5,903,000 bushels produced during 1959-60, and slightly above average. The value of production was estimated at \$17,482,000, 5 percent more than the previous year but 1 percent below the 10-year average. The acreage harvested in 1960-61 was estimated at 56,100 acres, slightly more than the 55,800 acres harvested in 1959-60 but 11 percent below average. The average yield for the entire crop year was 124 bushels per acre.

The fall 1960 growing season was dominated by excessive rainfall. Hurricane Donna added appreciably to this excess, causing delays in planting and resulting in some loss of acreage in south Dade County. The Everglades and Pompano sections were not appreciably hurt, but did receive too much rainfall during the period for best production results. The winter growing season was marked by excessive rain on January 12-13, particularly in Dade County. Growth in the Everglades was slowed by cold on January 21. Spring plantings were subjected to a cold air mass on March 10 and 11. Very little loss of acreage occurred in North Florida as early plantings were just coming up, but Everglades bean growers suffered heavy loss of acreage. Replanting was heavy but not complete as 2,000 acres were estimated to have been planted and not brought to harvest. Both spring and fall production from Zellwood and the Everglades areas were heavily utilized by processors.

CABBAGE

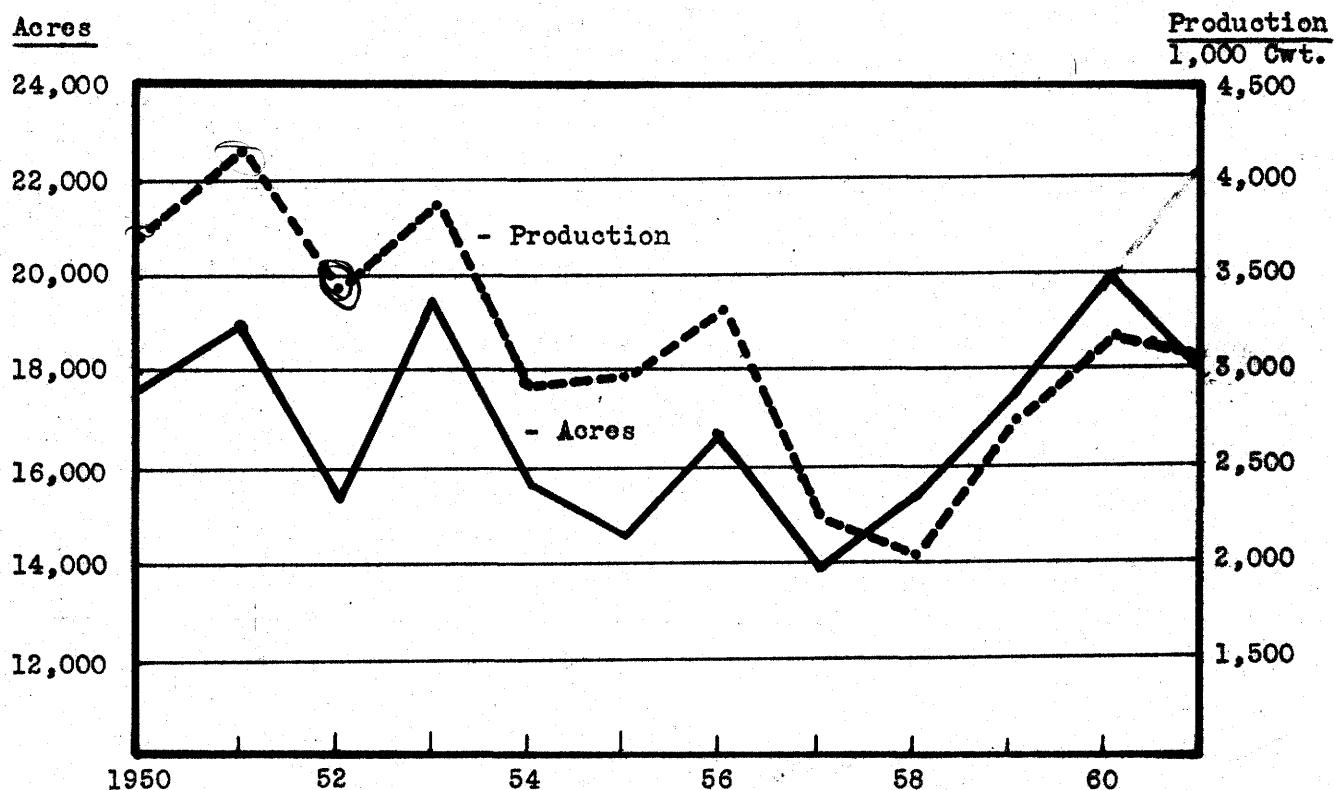

1960-61

Florida cabbage production during the 1960-61 crop year was 6,120,000 crates, 2 percent less than the 6,262,000 crates produced in 1959-60 and 1 percent less than average. Value of production in 1960-61 at \$5,130,000 was 24 percent less than last year and 21 percent below average. Acreage harvested in 1960-61 at 18,000 acres was less than 1 percent above last year and 8 percent more than average. Yield averaged 340 crates per acre for the entire crop year.

The favorable growing weather of October and November gave way to less favorable conditions in December. Several extensive masses of cold air moved across the State during the month. The main effect to the cabbage crop was light frost damage in the Hastings and Central Florida areas. The very cold temperatures of January 21-23 brought only relatively light damage again in the Hastings and Central Florida areas.

Weather in February was generally favorable for good growth as it was in March and April. Economic abandonment occurred throughout the crop year, principally due to the low market. Much of the cabbage abandoned was good quality. Palm Beach County harvested the largest acreage during the season followed by St. Johns, Putnam, and Flagler Counties in that order.

CANTALOUP

1960-61

Florida cantaloup production during the 1961 crop year was 75,000 hundredweight, 4 percent more than the 72,000 hundredweight produced in 1960 but 7 percent below average. Value of production in 1961 at \$450,000 was 1 percent more than last year and 11 percent above average. Acreage harvested in 1961 at 1,500 acres was 17 percent less than last year and 16 percent below average. Yield averaged 50 hundredweight per acre.

Weather conditions were generally very favorable to good vine growth throughout the State. Florida experienced a warm, dry spring that was instrumental in producing good to excellent quality lopes. Sizes were not large, however. Approximately 70 percent of the total production came from Alachua, Dade, and Marion Counties. The small acreage loss was principally due to extreme dryness in some localities where there was no irrigation.

CAULIFLOWER

1960-61

Florida cauliflower production during the 1960-61 crop year was 20,000 hundred-weight, 13 percent less than the 23,000 hundredweight produced in 1959-60 and 58 percent below average. Value of production in 1960-61 at \$176,000 was 19 percent less than last year and 53 percent below average. Acreage harvested in 1960-61 at 250 acres was 17 percent less than last year and 68 percent below average. Yield averaged 80 hundredweight per acre for the entire crop year. All the above cauliflower yield, production and value figures are on a close-trim (pre-packaging) basis to conform to the National trend.

Weather conditions during the 1960-61 growing season were quite variable. November, December, and most of January saw generally good growing conditions. However, the February and March temperatures for the most part were too high for good curd development. Therefore, much acreage was left unharvested due to lack of quality. Very light harvest activity continued into April and May.

CELERY

1960-61

Florida celery production during the 1960-61 crop year was 7,295,000 crates, 5 percent more than the 6,948,000 crates produced in 1959-60 and 7 percent above average. Value of production in 1960-61 at \$12,106,000 was 3 percent more than last year but 10 percent below average. Acreage harvested in 1960-61 at 10,200 acres was 10 percent less than the 11,300 acres harvested in 1959-60 and 5 percent less than average. Yield averaged 715 crates per acre for the entire crop year.

Weather conditions during the 1960-61 growing season were quite variable. Planting operations were interrupted during the week of September 16 by Hurricane Donna. Good weather prevailed through October and November. The crop was not damaged by several cold air masses that moved into the State during December. The principal weather factors affecting celery during January were the generally cool nights that prevailed most of the month and the mass of very cold air that covered the State January 21-23. Only very minor damage occurred even though freezing temperatures extended into the Everglades. February, March, April and May provided good to excellent growing conditions with the exception of March 10-11 when freezing temperatures retarded growth. Volume of harvest declined sharply after June 10. Palm Beach County led all others in harvested acreage with 7,520 of the 10,200 acre State total.

SWEET CORN

1960-61

Florida sweet corn production during the 1960-61 crop year was 6,088,000 crates, 17 percent less than the 7,326,000 crates produced in 1959-60 and 5 percent below average. Value of production in 1960-61 at \$14,464,000 was 7 percent more than last year and 25 percent above average. Acreage harvested in 1960-61 at 33,900 acres was 19 percent less than the 41,900 acres harvested in 1959-60 and 8 percent below average. Yield averaged 180 crates per acre for the entire crop year. Palm Beach County continued as the leading sweet corn producing county in 1960-61, producing 65 percent of the State's sweet corn production.

Weather conditions during the 1960-61 growing season were quite variable. Rains in September 1960 following the passing of Hurricane Donna caused some loss of acreage and delayed planting operations in the Everglades. Winds during December caused some windburn although not to a degree that would affect growth. On January 21-23, the mass of cold air that covered the State brought the first occurrence of general freezing and frost in the southern interior areas of the State. Damage to the winter corn acreage was very light. During February, growing conditions were generally favorable. March 10-11, frosts and freezing temperatures extended into practically all production areas with the heaviest loss occurring in the Everglades. Over 10,000 acres of sweet corn were lost completely. Replanting began immediately with over 6,000 acres being replanted. In the Zellwood area, acreage lost to the cold was very light. The favorable growing conditions that prevailed during April, May, and June were reflected in the record yields obtained.

CUCUMBERS

1960-61

Florida cucumber production for both fresh market and processing during the 1960-61 crop year was 3,355,000 bushels, 28 percent more than the 2,613,000 bushels produced in 1959-60 and 8 percent above the 10-year average. Value of production in 1960-61 at \$9,239,000 was 2 percent less than last year but less than 1 percent above average. Acreage harvested in 1960-61 at 16,100 acres was 3 percent less than the 16,600 acres harvested in 1959-60 and 4 percent less than average. Yield averaged 208 bushels per acre for the entire crop year.

Weather conditions during the 1960-61 growing season were variable. Hurricane Donna was responsible for a delay in fall planting in south Florida and considerable acreage loss in the Wauchula area where replanting was necessary. Favorable weather followed until the fall crop had been harvested. Acreage for winter harvest is normally in two definite periods--early and late. Cold winds of January 21-23 virtually ended production from the oldest group and severely damaged the younger crop. Planting for spring harvest was nearly complete by early March. February growing conditions were for the most part favorable. Frosts and freezing temperatures of March 10-11 which invaded practically every production area brought varying degrees of damage. For the most part, harvesting continued, but at reduced yields. Favorable temperatures continued through April and May. Irrigation was necessary in all areas.

EGGPLANT

1960-61

Florida eggplant production during the 1960-61 crop year was 1,000,000 bushels, 14 percent more than the 874,000 bushels produced in 1959-60 and 10 percent above the 10-year average. Value of production in 1960-61 at \$2,105,000 was 8 percent more than last year and 27 percent above average. Acreage harvested in 1960-61 at 2,700 was 16 percent less than last year and less than 1 percent below average. Yield averaged 370 bushels per acre for entire year. Palm Beach County continued as the principal eggplant producing county in 1960-61, producing 68 percent of the State's eggplant production.

Weather conditions during the 1960-61 season were varied but were generally favorable. The effects of Hurricane Donna were minimal since most of the eggplant acreage was located in the Palm Beach-Broward County area. Cold weather and winds during January and early February retarded growth and reduced production in some fields. Good growing weather during February and early March was halted temporarily by near freezing temperatures on March 10-11. There was some light loss of acreage at this time. The remainder of the season was generally favorable for good growth. Production from South Florida fields was virtually complete by June 1. Irrigation was very active where available throughout the spring months. The Plant City and North Florida areas were at peak production early in June, and excellent yields were obtained.

ESCAROLE

1960-61

Florida escarole production during the 1960-61 crop year was 2,880,000 crates, 3 percent less than the 2,976,000 crates produced in 1959-60 but 15 percent above average. Value of production in 1960-61 at \$2,673,000 was 16 percent less than last year and 2 percent below average. Acreage harvested in 1960-61 at 6,000 acres was 3 percent less than the 6,200 acres harvested in 1959-60 but 17 percent above average. Yield averaged 480 crates per acre for the entire crop year.

Weather conditions in the escarole producing areas of the State were varied during the crop year. Hurricane Donna caused some temporary setback in growing conditions, but this was followed by excellent weather through November. December saw several cold snaps move into the State. The accompanying frosts and winds damaged the crop in Central Florida. In January, another cold air mass moved into the State. Light frostburn and cold damage occurred in the Sarasota and Central Florida areas. Only spotted damage in colder field locations occurred in the Everglades area. Weather conditions were good until March 10-11 when freezing temperatures again moved into the important Everglades area inflicting some damage. Conditions were excellent the remainder of the season. Palm Beach County harvested 4,400 of the 6,000 acres harvested in the State

LETTUCE

1960-61

Florida lettuce production during the 1960-61 crop year was 276,000 hundredweight, 18 percent more than the 248,000 hundredweight produced in 1959-60 but 22 percent below average. Value of production in 1960-61 at \$1,325,000 was 16 percent less than last year and 13 percent below the 10-year average. Acreage harvested in 1960-61 at 2,900 acres was 12 percent less than 1959-60 and 17 percent below average. Yield averaged 95 hundredweight per acre for the entire crop year.

Weather conditions varied during the growing season, but were for the most part beneficial to lettuce production. Excellent conditions existed until December when some frost and wind damage occurred in Central Florida. In January, cold winds and frost again invaded the State, causing some damage to the crop in Central Florida, but only light damage in the Everglades area. Good weather then prevailed until March 10-11 when frost and cold winds once more brought damage to crops in all areas. Weather for the remainder of the season was generally good for growth and production. Counties leading in harvested acreage were: Palm Beach, Orange, Seminole, Highlands, and Hillsborough.

GREEN PEPPER

1960-61

Florida pepper production during the 1960-61 crop year was 4,943,000 bushels, 13 percent more than the 4,379,000 bushels produced in 1959-60 and 28 percent above average. Value of production in 1960-61 at \$12,628,000 was 2 percent less than the previous year but 15 percent above the 10-year average. Acreage harvested in 1960-61 at 13,200 acres was 2 percent less than the 13,400 acres harvested in 1959-60 but 3 percent more than average. The average yield for the crop year was 374 bushels per acre.

Plantings for early fall harvest were seeded to the field in August 1960 with some fall production coming from later plantings which extended through November. Early plantings in the Fort Myers-Immokalee area sustained a rather severe loss as a result of the wind and rains of Hurricane Donna. Heavy replanting was necessary. The entire producing area was affected by excessive fall rains. Some damage occurred in fields on the lower East Coast. Excessive leaching of fertilizer and washing of beds caused some replanting. Growth of the winter acreage was retarded by cold during January and again in early March. However, good production was obtained in most winter production areas. Spring plantings were below normal, but harvested yields were quite satisfactory. Mosaic infestations in spring plantings in the important Pompano area has caused an appreciable shift to earlier production. No serious cold or flooding rains came to affect this spring crop.

POTATOES

1960-61

Florida Irish potato production during the 1960-61 crop year was 5,810,000 hundredweight, 28 percent more than the 4,535,000 hundredweight produced in 1959-60 and 3 percent above average. Value of production in 1960-61 at \$13,286,000 was 25 percent less than last year and 22 percent below the 10-year average. Acreage harvested in 1960-61 at 34,100 acres was 9 percent less than the 37,300 acres harvested in 1959-60 and 11 percent below average. The yield for the entire season averaged 170 hundredweight per acre for all areas of the State. A record yield of 190 hundredweight per acre was obtained in the important Hastings area.

Planting of the winter potato crop was delayed by wet soils. In the Everglades, rains preceding Hurricane Donna caused a slow down in planting operations. In Dade County and the Fort Myers-Immokalee area, heavy rains in late October and early November restricted plantings temporarily. Growing conditions during December were generally favorable. On January 12 and extending into the 13th, unusually heavy rains in Dade County caused a sharp reduction in production. Yields in other winter producing areas were near average. Planting of the spring potato crop in the Hastings area was under generally favorable conditions. Stands obtained in most fields were good to excellent. The crop grew off with little or no adverse weather affecting the plants, which accounts for the record yield that was obtained in the Hastings area.

SQUASH

1960-61

Florida squash production during the 1960-61 crop year was 1,348,000 bushels, 6 percent more than the 1,268,000 bushels produced in 1959-60 and 21 percent above the 10-year average. Value of production in 1960-61 at \$3,783,000 was 17 percent less than last year but 23 percent above average. Acreage harvested in 1960-61 at 10,800 acres was 12 percent less than the 12,300 acres harvested in 1959-60 and equaled the 10-year average. Yield averaged 125 bushels per acre for the entire crop year. Predominating varieties by each major area of production were: Dade County, yellow crookneck; Pompano, yellow straightneck and green; Fort Myers-Immokalee, acorn; Plant City, yellow crookneck; Gainesville, yellow crookneck and yellow straightneck.

Weather conditions were varied throughout the State during the growing season. Hurricane Donna caused some acreage loss and delayed fall planting somewhat in South Florida. Temperatures and rainfall during November and December were favorable for growing and harvesting. The winter producing areas also received fairly good growing weather as the yield was excellent. March, April, and May weather was generally warm and dry with the exception of cold on March 10-11 which extended into practically all areas. Irrigation was used where it was available. Quality of fruit was good to excellent as disease problems were at a minimum.

SPINACH

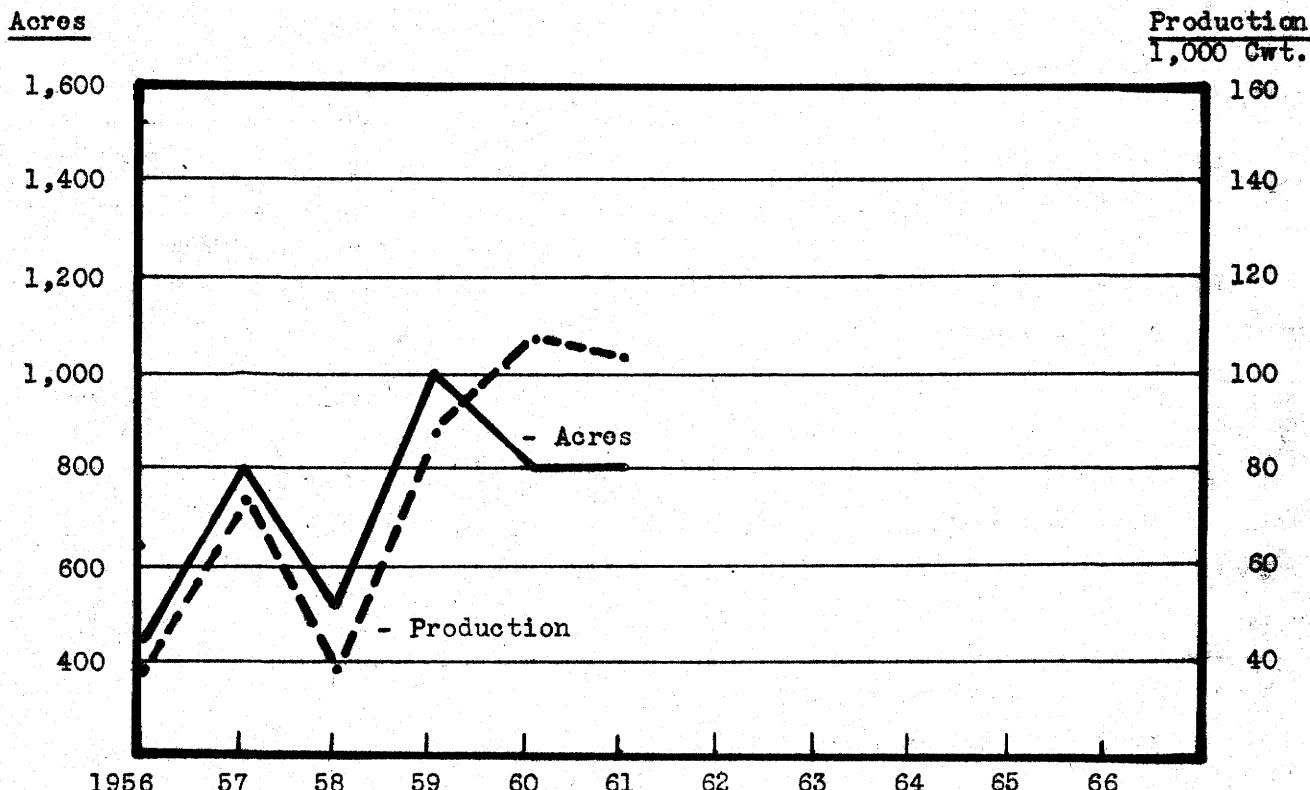

1960-61

Florida spinach production for processing during the 1960-61 crop year was 5,200 tons, 4 percent less than the 5,400 tons produced in 1959-60 but 51 percent above the 5-year average. Value of production in 1960-61 at \$174,000 was 8 percent less than last year but 13 percent more than average. Acreage harvested at 900 acres in 1960-61 was the same as the previous year but 23 percent above average. Yield averaged 5.8 tons per acre. All Florida spinach for canning and freezing was grown at Zellwood in Orange County.

Weather during the growing season was varied with several frosty mornings in late December and January. Harvesting began in January and was virtually complete by the first of March.

FLORIDA SPINACH
ACRES HARVESTED AND PRODUCTION 1956-1961

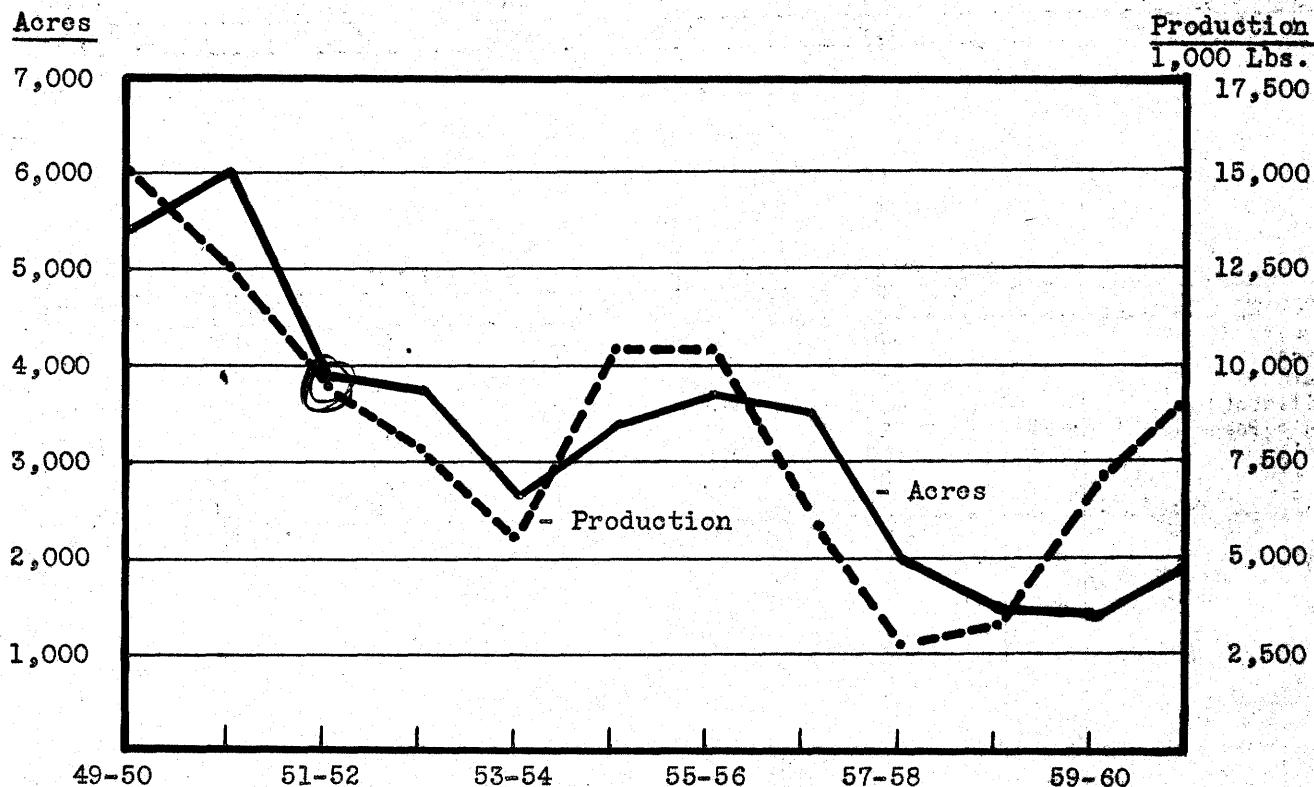

STRAWBERRIES

1960-61

Florida strawberry production during the 1960-61 crop year was 8,640,000 pounds, 21 percent more than the 7,140,000 pounds produced in 1959-60 and 13 percent above average. Value of production in 1960-61 at \$2,812,000 was 3 percent more than last year and 24 percent above average. Acreage harvested in 1960-61 at 1,800 acres was 29 percent more than last year but 43 percent below average. Yield averaged 4,800 pounds per acre for the entire crop year.

Weather conditions during the crop year were varied and at times very adverse for best growth. Cold winds and freezing temperatures were responsible for the loss of many blooms and some fruit, especially in the Plant City area. Growers in the lower East Coast area, which is the area of greatest production, experienced some trouble in getting plants to live after setting them out. Shipments during the season reached their peak in March. It is interesting to note that the usage of plastic to cover plant beds became general throughout the State this year.

TOMATOES

1960-61

Florida tomato production during the 1960-61 crop year was 12,532,000 crates, 48 percent more than the 8,454,000 crates produced in 1959-60 and 33 percent above average. Value of production in 1960-61 at \$49,015,000 was 10 percent more than last year and 12 percent above the 10-year average. Acreage harvested in 1960-61 at 41,300 acres was 8 percent more than the 38,300 acres harvested in 1959-60 but 23 percent less than average. Yield averaged 253 crates per acre for the entire crop year.

Weather conditions varied considerably during the growing season. Hurricane Donna, September 8-10, caused heavy acreage loss making much replanting necessary. Further reductions in fall acreage occurred from locally heavy rains in early October, however, growing and harvesting conditions were excellent from mid-October into December. Several cold air masses invaded the State in late December, retarding the growth of young vine-ripe and spring plantings. Cool nights in January along with the freezing temperatures of January 21-23 kept growth rates low. Heavy rains in Dade County accounted for some loss of acreage in mid-January. Conditions were generally good during February and early March. March 10-11 again saw cold winds and freezing temperatures invade the State with accompanying light damage to the tomato crop. Weather then improved and remained good for the rest of the growing season although dryness became a problem. The main tomato producing counties were Dade, Hendry, Palm Beach, and Manatee.

WATERMELONS

1960-61

Florida watermelon production during the 1961 season was 8,125,000 hundred-weight (36,111,000 melons), 3 percent less than the 8,395,000 hundredweight produced in 1960 but 13 percent above average. Value of production 1961 at \$12,188,000 was 2 percent more than last year and 7 percent above average. Acreage harvested in 1961 at 65,000 acres was 11 percent less than the 73,000 acres harvested in 1960 and 22 percent below average. Yield per acre averaged 125 hundredweight (555 melons). Based on production, Collier County was the leading watermelon producing county in 1961, followed by Hendry, second, and Sumter County, third in production.

South Florida counties began planting during November with first harvest coming during March with a light volume of shipments. Volume of harvest continued to increase as other areas of production began shipments. Peak shipments were reached during the week ending June 10 when over 3,800 carlot equivalents of watermelons were shipped out of the State. The cold wave that extended into all producing areas on March 10-11 damaged the crop in some areas, however, damaged crops recovered rapidly. High winds and rains March 31 caused some damage in the Fort Myers-Immokalee area. During April, lack of rainfall tended to retard growth in the central area while wet soils in west Florida hampered cultivation. Growing conditions during May and June were generally favorable for good yields of good quality melons.

a/ Included in Indian River.

1/ These totals include only the commercial vegetable crops listed in this booklet. Many counties have sizeable acreages of vegetable crops for which no official estimates are made.

Note: In order to avoid disclosing individual operations, some acreages are included in adjoining counties. Please refer to footnotes under those counties on pages 110-119.
